

Applying Formula Parser

RELEASE 2.4.0 OR ABOVE

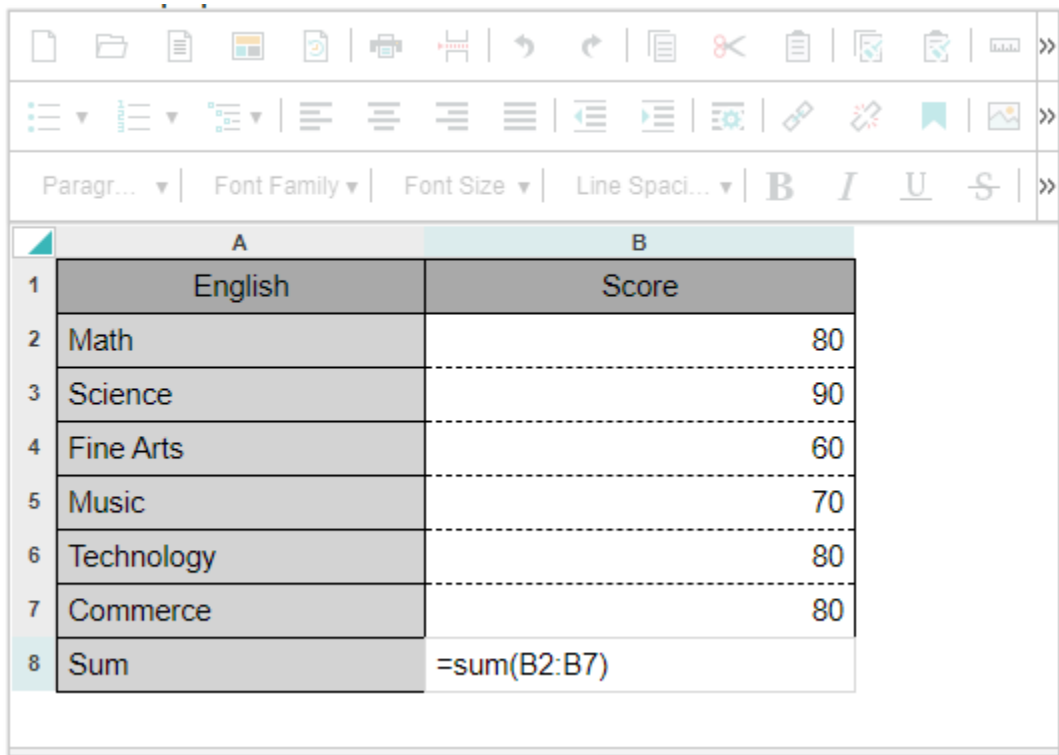

By applying Formula Parser, you can use excel functions in tables.

- If formula-parser script is not added to html, excel formula bar is not displayed.
- If formula-parser script is not added to html, you cannot use functions included in the imported excel document.

Using package externals

Use externlas formula-parser script file under package

```
<!-- formula-parser -->
<script type="text/javascript" src="../../resource/formula-parser.min.js"></script>
```

The screenshot shows a web application interface with a toolbar at the top containing various icons for file operations, editing, and formatting. Below the toolbar is a table with two columns, A and B. Column A contains subject names, and Column B contains scores. The table has 8 rows. The last row, row 8, contains the word 'Sum' in column A and the formula '=sum(B2:B7)' in column B. The formula bar at the top of the table is empty.

	A	B
1	English	Score
2	Math	80
3	Science	90
4	Fine Arts	60
5	Music	70
6	Technology	80
7	Commerce	80
8	Sum	=sum(B2:B7)
