

downloadAndUploadImages

RELEASE 2.9.5 OR ABOVE

If there is a specified URL pattern among the images included in the editor body, upload all images after downloading them. When all downloaded images are uploaded, the designated callbackFunc is called. By calling getPublishingHtml() in callbackFunc, you can get the HTML tag including the URLs of the changed images. If there is no specified pattern, only callbackFunc is called and immediately returned.

Parameters:

Name	Type	Attribute	Description
callbackFunc	Function		Specify the callback function to be executed after uploading all images (optional).
urlPattern	REGEXP		URL patterns of the images to be downloaded. If not specified, refer to the pattern set in the config file.

Example:

Promise

```
editor.downloadAndUploadImages(undefined, urlPattern).then(function() {  
    var html = editor.getPublishingHtml();  
});
```

Callback

```
function callback() {  
    var html = editor.getPublishingHtml();  
}  
editor.downloadAndUploadImages(callback, urlPattern);
```
