

Table

Table extends [Element](#)

The API model used to edit tables.

Methods

- [deleteCol\(startIndex\[, endIndex\]\)](#)
- [deleteRow\(startIndex\[, endIndex\]\)](#)
- [deleteContents\(\)](#)
- [insertCol\(index\)](#)
- [insertRow\(index\)](#)
- [mergeCell\(startRowIndex, startColIndex, endRowIndex, endColIndex\)](#)
- [replace\(html\)](#)
- [remove\(\)](#)
- [setColWidth\(index, value\[, unit = 'px'\]\)](#)
- [setRowHeight\(index, value\)](#)
- [setHeight\(value\[, unit = 'px'\]\)](#)
- [setWidth\(value\[, unit = 'px'\]\)](#)

deleteCol(startIndex[, endIndex])

- `startIndex <Number>` : The start position of column to delete (starts from 0)
- `endIndex <Number>` : The end position of column to delete

Deletes the specified column from the table. The `startIndex` value starts from 0, and if `endIndex` is not specified, only the column corresponding to `startIndex` is deleted.

```
var table = editor.getAPIModelById('id');
table.deleteCol(1); // Delete the second column
table.deleteCol(1,3); // Delete from second to fourth column
```

deleteRow(startIndex[, endIndex])

- `startIndex <Number>` : The start position of row to delete (starts from 0)
- `endIndex <Number>` : The end position of row to delete

Deletes the specified row from the table. The `startIndex` value starts from 0, and if `endIndex` is not specified, only the row corresponding to `startIndex` is deleted.

```
var table = editor.getAPIModelById('id');
table.deleteRow(1); // Delete the second row
table.deleteRow(1,3); // Delete from second to fourth row
```

deleteContents()

Deletes all contents of cells inside the table.

```
var table = editor.getAPIModelById('id');
table.deleteContents();
```

insertCol(index)

- `index <Number>` : Position of the column to be added

Adds a column at the specified location.

```
var table = editor.getAPIModelById('id');
table.insertCol(1);
```

insertRow(index)

- index <Number> : Position of the row to be added

Adds a row at the specified location.

```
var table = editor.getAPIModelById('id');
table.insertRow(1);
```

mergeCell(startRowIndex, startColIndex, endRowIndex, endColIndex)

- startRowIndex <Number> : Start position of row to be merged
- startColIndex <Number> : Start position of column to be merged
- endRowIndex <Number> : End position of row to be merged
- endColIndex <Number> : End position of column to be merged

Merges the specified cells.

```
var table = editor.getAPIModelById('id');
table.mergeCell(0, 0, 1, 2);
```

replace(html)

- html <String> : The HTML String to replace.

Replaces the element itself with the HTML String passed as an argument.

```
var table = editor.getAPIModelById('id');
table.replace('<span>Table replaced</span>');
```

remove()

Removes the Element itself.

IF ALL ELEMENTS ARE REMOVED, ERRORS MAY OCCUR IN SUBSEQUENT OPERATIONS.

```
var table = editor.getAPIModelById('id');
table.remove();
```

setColWidth(index, value[, unit = 'px'])

- index <Number> : Position of the column to set.
- value : Width
- unit : Unit of width('px', '%'). default 'px'.

```
var table = editor.getAPIModelById('id');
table.setColWidth(1, 100, 'px');
table.setColWidth(1, 20, '%');
```

setRowHeight(index, value)

- index <Number> : Position of the row to set.
- value : Height. Row height can only be set to 'px'.

Sets the height of the specified row.

```
var table = editor.getAPIModelById('id');
table.setRowHeight(1, 100);
```

setHeight(value[, unit = 'px'])

- value<Number> : height
- unit <String> : Unit of height ('px', '%'). default 'px'.

Sets the height of the table.

```
var table = editor.getAPIModelById('id');
table.setHeight(200);
table.setHeight(200, 'px');
```

setWidth(value[, unit = 'px'])

- value<Number> : Width
- unit <String> : Unit of width ('px', '%'). default 'px'.

Sets the width of the table.

```
var table = editor.getAPIModelById('id');
table.setWidth(400);
table.setWidth(100, '%');
```
