

TableRow

TableRow extends Element

The API model used to edit rows in a table.

Methods

- `deleteRow()`
- `insertRow([before = false])`
- `setRowHeight(value)`

deleteRow()

Delete the row.

```
var row = editor.getAPIModelById('id');
row.deleteRow();
```

insertRow([before = false])

- `before <Boolean>` Whether to add a line before

Add a line after it. If the before value is true, a row is added before the row.

```
var row = editor.getAPIModelById('id');
row.insertRow();           // add row after row
row.insertRow(true);      // add row before row
```

setRowHeight(value)

- `value <Number>` Height of row. The unit of value is 'px'.

Sets the row height.

```
var row = editor.getAPIModelById('id');
row.setRowHeight(50);
```
